

Waste Management System App

A Servoy Solution

Executive Summary:

A leading waste management group from Europe who provide waste management services to a host of industries hired our services to design a comprehensive waste management solution. This particular solution had to be tailored to meet the specific waste disposal and recovery needs of the various industries that this company catered to. On the technical front the application was to be re-created in Servoy with more features and a completely new design. Some of the finer requirements that the client asked us to implement are as follows:

- ✓ Manage companies having different locations with different people with different responsibilities
- ✓ Manage the responsible person for collection, for invoice and for contact
- ✓ Efficiently handle the enquiries for waste collection
- ✓ Optimize waste collection by suggesting the transport person the routes they must follow for collection
- ✓ Application should have the facility to create an invoice once the waste has been duly collected
- ✓ Manage a library of generic wastes
- ✓ Application should be extremely user-friendly

Mindfire Solutions responded proactively to the above requirements and did a commendable job for the client. The client was extremely pleased with the services offered by Mindfire as well as the developer carrying out the job.

About our Client:
