

Performance Testing for an Eyewear App

Introduction:

The client is a leading U.S. eyewear retailer offering fast, affordable, and convenient eye care services. They provide same-day eye exams and an extensive selection of eyeglasses and contact lenses. Through on-site labs, same-day service, and tele-optometry solutions, they deliver a modern, technology-driven experience that makes vision care more accessible.

With a national footprint spanning over 100 locations, the client has become a major player in the vision-care space, providing cost-effective eyewear, comprehensive eye exams, and customer-centric services. They are committed to making quality vision care both affordable and accessible, combining innovative optical technology with competitive pricing and a streamlined in-store experience. Operating as a high-volume, value-driven optical retailer, the client integrates telehealth capabilities, on-site labs, and a diverse product portfolio to deliver efficient, low-cost eye care and eyewear solutions.

Client Details:

Name: Confidential | **Industry:** eCommerce, Retail and Software | **Location:** USA

Technologies:

- **Front end:** HTML5, ReactJS (Next.js), TypeScript, Material UI, CSS,
- **App Layer:** Azure App Service
- **Business/API Layer:** API Management (Premium), Azure Functions
- **Backend Layer:** Azure Cosmos DB, Azure SQL Database
- **Storage Layer:** Azure Storage
- **Middleware:** Azure Service Bus
- **ETL:** Azure Data Factory
- **Tools:** Visual Studio 2022 Professional Edition, Azure Data Studio, ReSharper (Visual Studio Extension for .Net)
- **Storage:** Azure Repository

Technologies Used for Performance:

- **Tool Used for Scripting:** Apache JMeter
- **Tool Used for Load Testing:** Azure Load Testing Service
- **Tool Used for Root Cause Analysis:** Azure Application Insights

Performance Testing for an Eyewear App

Project Description:

The client is a leading eyewear retail brand renowned for delivering exceptional customer service and offering thousands of stylish, affordable frames. Their affiliated network of in-store doctors provides comprehensive eye examinations and detailed vision health assessments, delivering a seamless, full-service experience. An expert team guides customers throughout the selection and purchasing process. The client also offers same-day delivery of prescription glasses where feasible—setting a high standard in customer satisfaction and operational efficiency.

To maintain competitiveness in the rapidly evolving eyewear industry, the client engaged with us to conduct a comprehensive Performance Testing. Their primary objective was to assess the application's reliability, scalability, and stability under various load conditions. The client required a custom performance testing framework capable of running automated daily load tests, including performance regression to consistently monitor the application's health. A key requirement was the generation of actionable performance reports for each execution cycle to help stakeholders make informed decisions about application readiness for release.

Engagement Objectives:

Mindfire's Performance QA team collaborated closely with the client to gain a deep understanding of:

- Application architecture
- Key functional modules
- Current performance challenges and bottlenecks
- Expected workload patterns and usage volumes

The client sought an **end-to-end performance assessment** that would simulate realistic user behaviour across different modules and provide clear insights into system behaviour under varying load scenarios

Approach & Key Activities:

1. Requirements & Environment Setup

- The Performance QA team gathered detailed Non-Functional Requirements (NFRs) through continuous discussions with stakeholders, including user volume, workflow distribution, architecture details, and module-specific performance expectations.

Performance Testing for an Eyewear App

- A dedicated Performance Test Environment was created in collaboration with the DevOps team. This environment mirrored the production setup to ensure high test accuracy and reliability.

2. Tooling & Scripting

- Apache JMeter, an open-source performance testing tool, was selected for scripting
- Azure Load Testing service used for executing load scenarios
- Customized test scripts were created to simulate end-to-end workflows and peak user activity across various application modules.

3. Monitoring & Root Cause Analysis

- Integrated monitoring was implemented using Azure Application Insights, enabling deep-dive root cause analysis for every performance issue identified.
- Key metrics included response times (Average, P50, P90, P95), error percentages, throughput, CPU utilization, memory consumption, and API-level performance.

4. CI/CD Integration & Automation

- The performance test suite was integrated into the client's Azure CI/CD Pipeline, enabling daily automated performance health checks.
- Stakeholders gained the ability to trigger builds, execute performance tests, and access results directly through the pipeline dashboard.

5. Reporting & Issue Management

- Detailed performance reports were generated after each execution cycle, providing insights into page-level and API-level performance trends.
- All performance issues were logged as tickets, tracked rigorously, and validated with the development team until resolution.

Methodology followed:

We followed Agile Scrum with Daily Standups and Sprint-based deliveries.

Performance Testing for an Eyewear App

Application Architecture Design:

Workflow: Performance Testing

Performance Testing for an Eyewear App

Apache JMeter Workflow:

JMeter simulates a group of users sending requests to a target server, and returns statistics that show the performance/functionality of the target server/application via tables, graphs, etc.

Screenshots:

A JMeter test plan looks like as below

Performance Testing for an Eyewear App

Performance Testing Report :

The screenshot shows a document titled "Performance Testing Report". It includes sections for "Test Case", "Test Scenario", "Test Data", "Test Results", and "Test Summary". The "Test Results" section contains a table with columns for "Test Case", "Test Scenario", "Test Data", "Test Results", and "Test Summary". The table lists various test cases and their corresponding results.

Test Case	Test Scenario	Test Data	Test Results	Test Summary
TC_001	TC_001	TC_001	TC_001	TC_001
TC_002	TC_002	TC_002	TC_002	TC_002
